
# ABS

Pipe, Fittings & Valves for cooling, chilled water, chemicals and drinking water

Technical Information 2011

+GF+

GEORG FISCHER
PIPING SYSTEMS

## Technical Information

For technical data including operating & control pressures, dimensions as well as the use of accessories, please refer to data sheets which are available in both printed and electronic (pdf) formats from the Coventry Sales Office (details on back cover).

For details of our range of plastic pipe, fittings, hand and actuated operated valves in PVC-U, PVC-C, PP, PVDF, PFA and PE as well as our INSTAFLEX PB and SIGNET measurement and control range, please request Price Lists from the Coventry Sales Office.

# Application Knowledge

## GF ABS

Water, chilled water, cooling, drinking water & chemical conveyance

**Fields of Application:**

Water treatment
Chemical industry
Drinking water
Swimming pools
Marine industry
Food and beverage production
Building services

**Product Range**

Pipes
Fittings
Manual valves
Actuated valves
Jointing systems
Flow, pH, conductivity, turbidity, level, pressure, chlorine and temperature measurement

Available in the widest standards available: BS Inch, EN/ISO metric

EN/ISO - d16 - d315mm

BS Inch - 3/8" - 8"

Application range:

Resistant to bases, weak acids and salts, suitable for drinking water
-40°C to 60°C

Jointing system:

Tangit gap filling solvent cement

## Worldwide Approval

GF ABS is manufactured and tested to the highest quality. Our own compound and strict quality controls for each raw material delivery form the basis for our high quality products.

Our own independently accredited test laboratory for components of plastic piping systems according to EN ISO 45001 assures the highest quality.

Quality and environmental management systems according to ISO 9001 and 14001 are the basis for the continuous improvement of our performance.

Third party approvals for GF ABS offer peace of mind to customers using the products.

**Approved for use within public water supplies and by the Secretary of State. GF ABS is listed in the "List of Approved Products" published by the DWI**

## Distribution, Warehousing and Technical Support

The excellent location of the Distribution Centre in Coventry offers the latest in state of the art distribution and warehousing systems. An enhanced delivery system and 24 hour warehousing programme guarantees prompt delivery to GF customers nationwide.

Our Technical support staff are qualified to offer you advice and guide you through the wealth of products GF can supply. We make sure you feel confident that the product matches your requirements and leaving you fully assured that GF is your preferred supplier.

GF Fleet of delivery vehicles

Tracking delivery of your order

## Automation

GF manufacture a complete range of actuators and actuated valves which includes pneumatic as well as electric actuators. Thanks to their modular design, the actuators can be configured specifically to your application (eg. positioner, additional limit switches, fail-safe unit, AS-Interface connection, etc.) Housing material is robust and resistant PPGF. All actuators are sized specific to GF valves, resulting in an increased service life. Connections to third party valves are no problem due to EN ISO 5211 interface.

## SIGNET

The GF Signet range of flow control and measurement equipment is at the cutting edge of technology in this field.

Flow, pH, level, conductivity, temperature, turbidity, chlorine, pressure and ORP are all catered for within the range.

# Materials used for industrial pipe work

**General**
Acrylonitrile-Butadiene-Styrene (ABS) is a versatile standard polymer. In addition to its application in piping systems, ABS is mainly common in automotive applications and in high-quality household devices. The wide area of application relates to the versatile characteristic profile of ABS. It can be adapted to the application by varying the composition of its three components: acrylonitrile, styrene and polybutadiene. While acrylonitrile provides strength to the material and gives ABS an improved chemical resistance relative to polystyrene, the styrenic component provides both strength and a quality surface finish. The chemically bound polybutadiene-rubber particles, on the other hand, give the material its toughness and impact strength, even at very low temperatures. The ABS used by GF shows a good balance between toughness and strength, making it especially suitable for low temperature applications. Accordingly the areas of application are mainly refrigeration and air conditioning systems as well as water treatment.

The advantages of ABS include:

- high impact strength even at low temperatures
- corrosion resistance
- simple installation via solvent cement joints
- low heat conductivity
- halogen free
- non-toxic
- biologically inert; no support of microbial growth
- low weight
- low pressure losses due to smooth surfaces
- good abrasion resistance
- problem-free recycling

**Mechnical properties**
In addition to the good strength and stiffness, ABS is especially characterised by a very high impact strength. Impact strength is a measure of impact energy that the material absorbs until it breaks. For this test, a specimen is weakened with a sharp notch and then struck. Without a notch, there is no breakage of the test specimen. The exceptionally high notched impact strength values, even at low temperatures, indicate the material's high robustness and tolerance against surface damage. GF ABS pipes are routinely tested for their toughness according to EN ISO 15493. In this test, a weight falling from, a height of 2 metres hits the pipe that has been cooled to 0 °C. The mass of the falling weight varies, depending on the pipe dimensions, from 0.5 (dn = 20mm) to 9 kg (dn = 225 mm). The high load in the falling-weight test ensures that the excellent toughness of the material is not reduced as a result of processing into pipe. The internal pressure resistance is provided by the hydrostatic strength curve based on the EN ISO 15493 standard (also see the ABS Calculation and Long-Term Behaviour section). The application limits for pipes and fittings, as shown in the pressure-temperature diagram, can be derived from these curves.

**Chemical, weathering and abrasion resistance**
ABS is characterised by its good resistance to various chemicals. In general, ABS is resistant to water, salt solutions and most dilute acids and bases. Its resistance to alcohols, aliphatic hydrocarbons, oils and greases is, however, to be regarded as limited. ABS is not resistant to concentrated mineral acids, organic acids and solvents such as esters, ketones and chlorinated and aromatic hydrocarbons. For detailed information, please refer to the detailed list of chemical resistance from GF or contact your local GF subsidiary. If the ABS piping system is exposed to direct sunlight over a long period, its surface loses its shine and the colour shifts to light grey. Due to the very high impact strength of ABS, the resulting loss of toughness generally causes no problems in moderate climate zones. For extreme weather conditions or very high loads on the piping system, we nevertheless recommend protecting the surface from direct sunlight. In addition to the excellent impact strength, the polybutadiene rubber particles in ABS cause an outstanding resistance against abrasion. Because of this, ABS piping systems have been used for a long time to transport solids and slurries, for example, in mining applications. Experience has shown that ABS, as well as PE, offers considerable advantages over metal and other plastics for many such applications. Please contact GF if you are planning such an application. We would be glad to advise you about the suitability of our ABS, PE and other materials for your media.

**Thermal properties**
The outstanding characteristics of ABS allow its application in a wide temperature range between - 40 °C and +60 °C. At higher temperatures, the tensile strength and stiffness of the material drop and at lower temperatures, they rise. Therefore, please consult the pressure-temperature diagram for your maximum working temperature. As all thermoplastics, ABS shows a higher thermal expansion than metals. This is not a problem if the thermal expansion is taken into account during the planning stage of the piping system. The expansion coefficient amounts to 0.1 mm/m K in the application temperature range.
At 0.17 W/m K, the heat conductivity of ABS is very low. Because of the insulation properties of the material and the resulting savings in energy or insulation, an ABS piping system is notably more economical in comparison to a system made of copper (370 W/m K) or other metals. Should there be a need for additional insulation, e. g. in cooling applications, GF offers COOL-FIT, a system specially dedicated to this market. COOL-FIT it is a preinsulated ABS system that has the advantage of quick and easy installation.

**Combustion behaviour**
ABS self-ignites at temperatures exceeding 450 °C. ABS burns when exposed to an open flame. After removing the flame, the material continues burning. The oxygen index amounts to 19 %. (Materials that burn with less than 21 % of oxygen in the air are considered to be flammable). According to UL-94, ABS has a HB (Horizontal Burning) flammability coefficient and falls into building material class B2 (conventional inflammable, non-dripping) according to DIN 4102-1. Basically, toxic substances are released by all burning processes. Carbon monoxide is generally the combustion product most dangerous to humans. When ABS burns, primarily carbon dioxide, carbon monoxide and water are formed. Tests have shown that the relative toxicity of the products of combustion are similar or even lower than those of natural products such as wood, wool and cotton. ABS combustion gases are not corrosive. Nevertheless, the burning forms soot. Because of this, smoke develops during combustion. Water, foam and carbon dioxide are suitable fire-fighting agents.

**Electrical properties**
ABS has good electrical insulation capacity. The specific volume resistance is 3.5 x 1016 Ωcm and the specific surface resistance is 1013 Ω.
These figures have to be taken into account wherever there is a danger of fires or explosion.

# Design of metric and inch piping systems

## Application area of pipes and fittings

### Pressure/temperature diagram for ABS

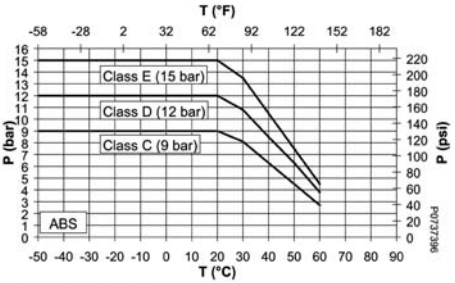
The following pressure/temperature diagram for ABS pipes and fittings is valid for a lifetime of 25 years.
The design factor of 2.1 for inch-based systems and 1.8 for metric systems recommended by GF is incorporated.
It can be used for water or media resembling water, in other words, media which have no derating factor regarding the chemical resistance.

**Remark**: Please take into account the pressure/temperature diagrams for valves and special fittings. Because of the construction and/or sealing material used, differences are possible when compared with pipes and fittings. This information can be found in the planning fundamentals of the relevant types of valves, respectively special fittings.
The influence of the anti-freeze compound has to be taken into account when calculating the allowable operating pressure. Please contact your GF representative for further information.

**Attention**: According to the 10 °C curve in the long-term diagram for ABS, the permissible pressure in the temperature range -50 ° to +10 °C can be
- 7.5 bar for the PN6 system.
- 11.8 bar for the PN10 system.

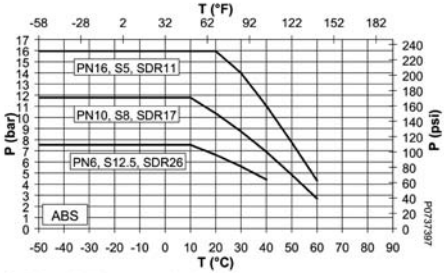
The maximum pressure for the PN16 system has been limited to 16 bar.

**Inch-based systems**



P Permissible pressure in bar, psi
T Temperature in °C, °F

**Metric-based systems**



P Permissible pressure in bar, psi
T Temperature in °C, °F

# Installation of metric industrial piping systems

## Change in length and flexible sections

### Introduction

**General**

Thermoplastics are subject to greater thermal expansion and contraction than metals. Pipes installed above ground, against walls or in ducts, especially those exposed to temperature variations, require changes in length to be taken up in order to prevent extra strain on the pipes. Length changes can be taken up by:

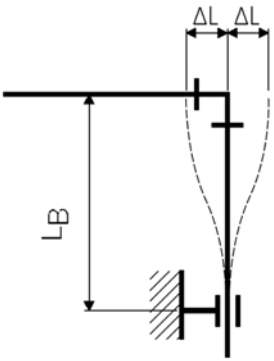
a) flexible sections

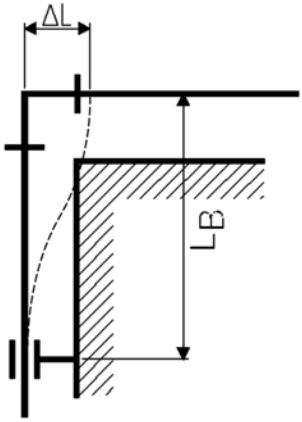
b) compensators

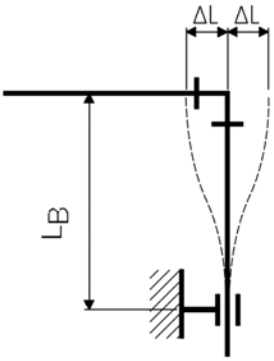
Flexible sections are the most common solution, being the simplest and the most economical. The calculations for and the positioning of flexible sections are therefore described in detail.

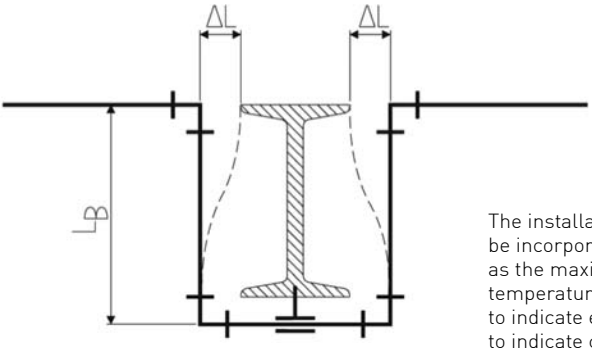
**Fundamentals**

The low modulus of elasticity of thermoplastics allows changes in length to be taken up by special pipe sections, where pipe supports are positioned so that they can take advantage of the natural flexibility of the material. The length of such sections is determined by the diameter of the pipeline and the extent of the thermal expansion to be compensated. Flexible sections arise naturally at any branching or change in direction of the pipeline. The movement LB of the flexible section as a result of a change ΔL in the length must not be restrained by fixed pipe brackets, protrusions wall, girders or the like.









The installation temperature must therefore be incorporated into the calculations as well as the maximum and minimum operating temperatures. It is preferable to use "+" to indicate expansion of the pipe and "-" to indicate contraction. The larger change in length is the one to be used for determining the required length of the flexible section.

**Calculation of change in length**
The **change in length caused by temperature** can be calculated using the following formula:

$$\Delta L = L\ \Delta T\ \alpha$$

with:
- ΔL = temperature-related change in length (mm)
- L = length of the pipe section (m)
- ΔT = difference of temperature (K)
- $\alpha$ = coefficient of linear expansion (mm / m K)

**Coefficients of linear expansion of polymers:**

| Material | α in mm/m K |
|---|---|
| ABS | 0.10 |
| pre-insulated ABS | 0.02 - 0.08* |
| PA | 0.10 |
| PB | 0.13 |
| PE | 0.15 - 0.20 |
| PP | 0.16 - 0.18 |
| PPS | 0.15 |
| PVC-U | 0.07 - 0.08 |
| PVC-C | 0.06 - 0.07 |
| PVDF | 0.12 - 0.18 |

* Exact values can be calculated using GF's online tool or ask your local GF representative.

$$L_B = \sqrt{\frac{3\ d_a\ \Delta L\ E_{cm}}{\sigma_b}}$$

with:
- $d_a$ = pipe outside diameter (mm)
- ΔL = change in length (mm)
- $E_{cm}$= average bending creep modulus for t = 25 a (N/mm²)
- $\sigma_b$= permitted bending stress for t = 25a (N/mm²)

**Tip**: If the operating temperature is higher than the installation temperature, then the pipe expands. If, on the other hand, the operating temperature is lower than the installation temperature, then the pipe contracts in length.

**Remark**: Because $E_{cm}$ and $\sigma_b$ are depending on time, temperature and stress, the calculation of $L_B$ is very difficult. Therefore the following diagrams should be used instead of the formula.

### Boundary conditions for using the diagram

For easy determination of the required length of flexible section please use the following diagrams. Please take into account the given boundary conditions.

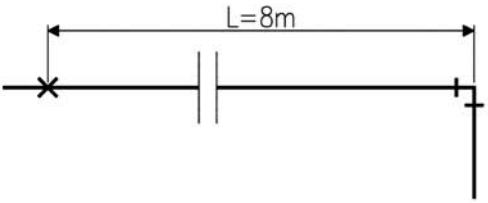
- Assembly temperature $T_M$ = 20 °C
- $T_B$ Operating temperature
- $\Delta T = T_B - T_M$
- allowable bending stress 15 % of $\sigma_v$
- PN 6 .. 16
- Coefficient of friction of the pipe in the loose brackets $\leq 0.5$

**Information**:
The following diagrams show the required flexible sections for straight pipe lengths of 10 m or 70 m. Exceeding the maximally permissible straight pipe distance would lead to buckling of the pipe due to the too large friction in the pipe clamps. Therefore the maximally possible pipe length is to consider depending on the pipe diameter =>above the hatched range.

### Example: Determining the required flexible section

**Calculating the relevant change in length**
The example of an ABS process pipe serves to illustrate the procedure:
Length of piping from the fixed point to the branch point where the change in length is to be taken up:

- L = 8 m.
- Installation temperature: $T_M$ = 20 °C
- Max. working temperature: $T_1$ = 35 °C
- Min. working temperature: $T_2$ = -20 °C



Expansion of the section during heating
$+\Delta L_1 = L \cdot \Delta T_1 \cdot \alpha = 8 \cdot 15 \cdot 0.10 = 12$ mm

Contraction during cooling
$-\Delta L_2 = L \cdot \Delta T_2 \cdot \alpha = 8 \cdot 40 \cdot 0.10 = 32$ mm

Temperature differences
$\Delta T_1 = T_1 - T_M = 15$ °C
$\Delta T_2 = T_2 - T_M = -40$ °C

Maximum change in temperature chosen
$\Delta T = 40$ °C

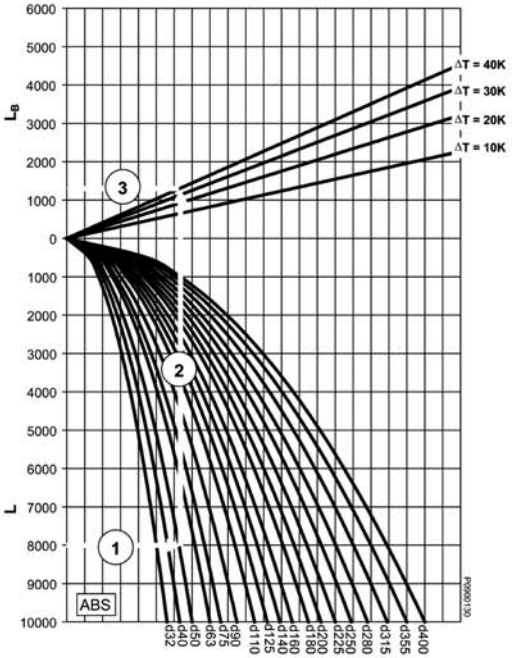
**Determining the length of the flexible section for ABS**

The values needed to determine the necessary length are:

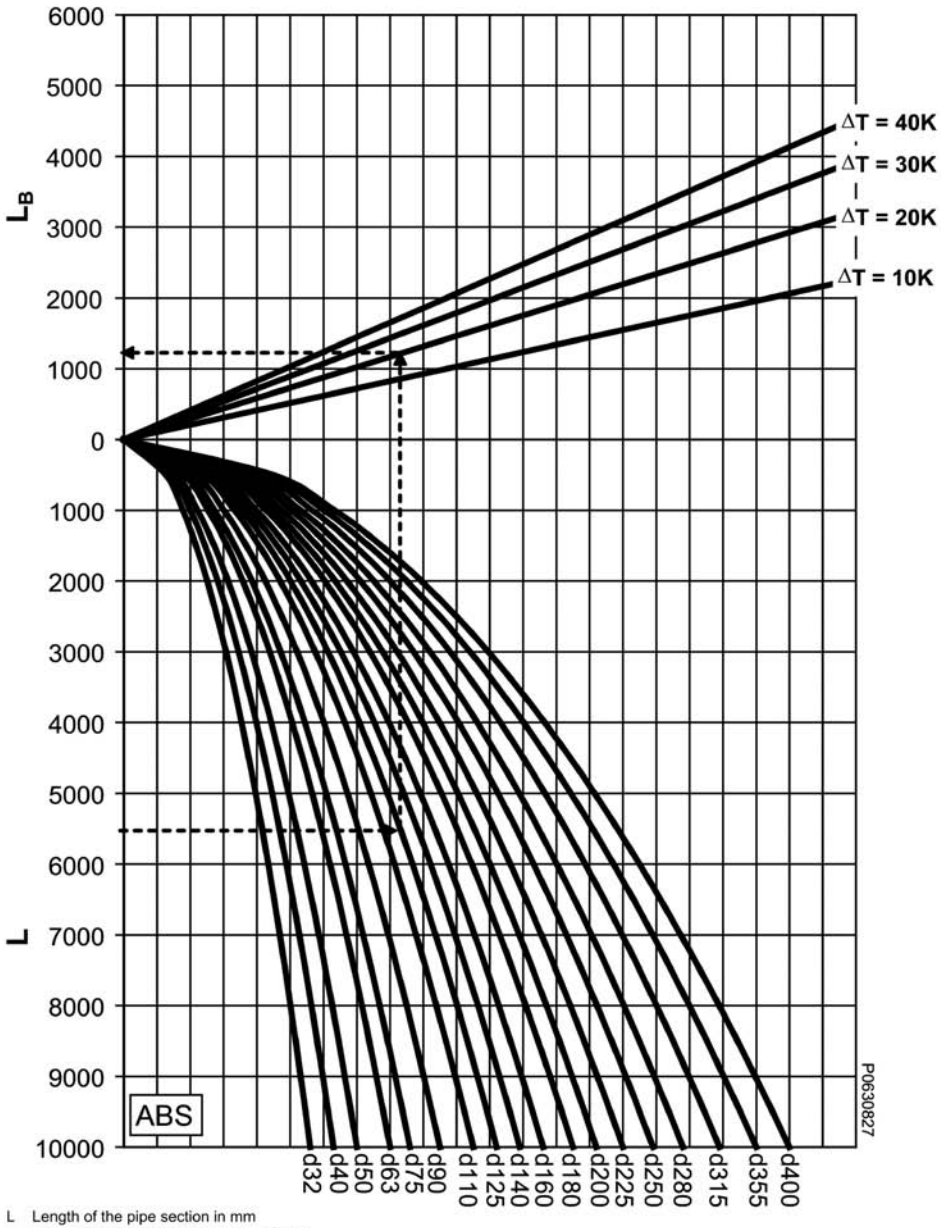
- The maximum change in temperature from the 0-position (i. e. from the position in which the pipe was installed). But remember that the pipe could just as well contract as expand.
- The pipe diameter d.
- The length of the pipe section L.

With these values the required length of the flexible section can be read off from the diagram for ABS.

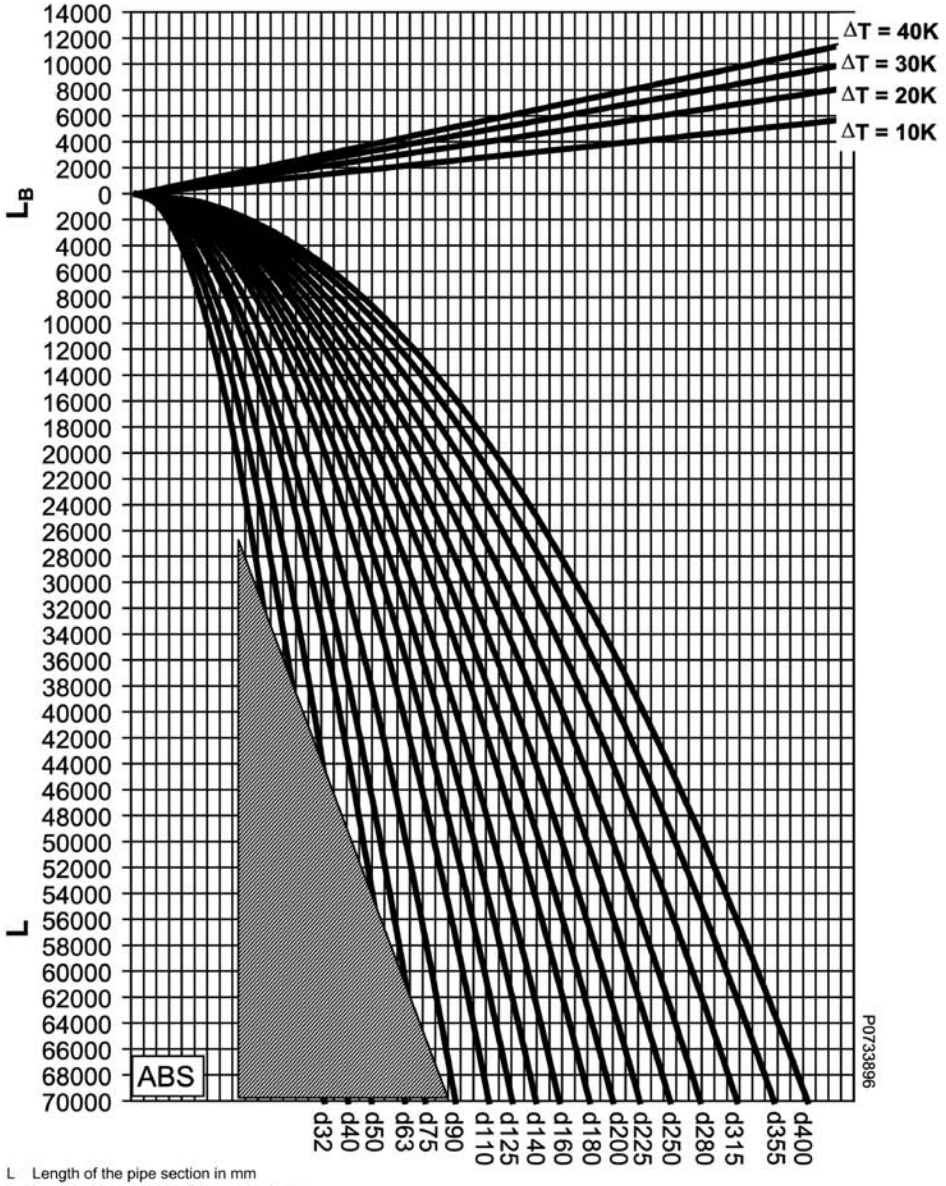
Continuing with the example introduced before and supposing that an ABS pipe with d = 50 mm is installed, the maximum change in temperature being ΔT= 40 °C, the required length of the flexible section is seen directly from the diagram to be $L_B$ = 1300 mm.



The diagram can be used also the other way around, if a maximum flexible section caused by the building construction is given. Then the maximum straight length of the pipe can be determined.



L Length of the pipe section in mm
$L_B$ Required length of flexible section in mm



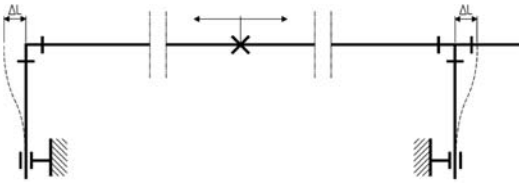
L Length of the pipe section in mm

$L_B$ Required length of flexible section in mm

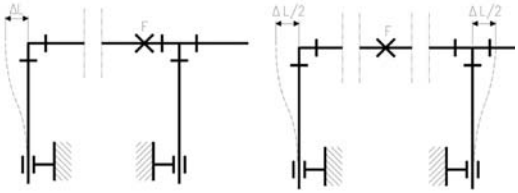
Remark: Please observe the explanations to the hatched area in the clause boundary conditions

# Installation of metric industrial piping systems

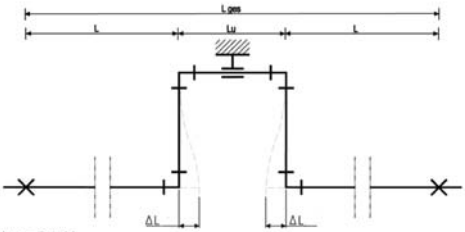
**Recommendations for installation**
Length changes in pipe sections should always be accommodated through the arrangement of fixed brackets. The following examples show how the changes can be distributed in pipe sections by suitable positioning of fixed brackets.



not recommended recommended



Expansion loops can be installed to take up changes in length when flexible sections cannot be included at a change in direction or branch in the pipeline or if substantial changes in the length of a straight section need to be taken up. In such a case the compensation for changes in length is distributed over two flexible sections.



Lu ≥ 2 * ΔL

**NOTICE**

**Bending load at flexible sections**
Caused by the bending load leakages can occur at mechanical joints.

- Within the range of flexible sections and/or expansion loops no screw connections or flange connections shall be used.

**Pre-stress**
Length changes in pipe sections should always be accommodated through the arrangement of fixed brackets.

The following examples show how the changes can be distributed in pipe sections by suitable positioning of fixed brackets.

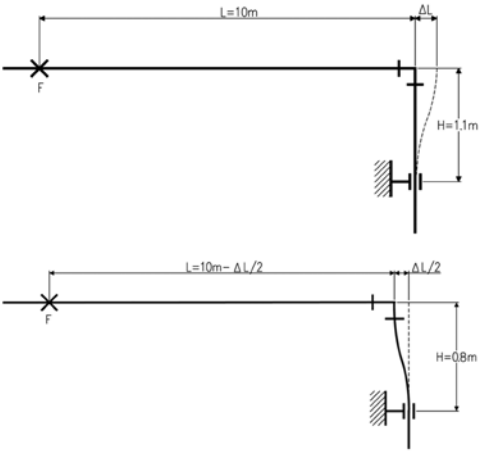
| | |
|---|---|
| Installation data: | L = 10m<br>d = 50mm |
| Installation temperature: | 15 °C |
| Max. operating temperature: | 40 °C |
| Material: | ABS |

a) Change in length
$+\Delta L = L * \Delta T * \alpha_{ABS} = 10 * 25 * 0.10 = 25$ mm

b) A flexible section to take up a change in length of ΔL = 25 mm needs to be $L_B$ = approx. 1150 mm long according to the diagram.

c) If the flexible section is pre-stressed to ΔL/2 then the required length of the flexible section is reduced to about 800 mm. The variation length from the 0 position is then ±ΔL/2 = 25/2 = 12.5 mm.

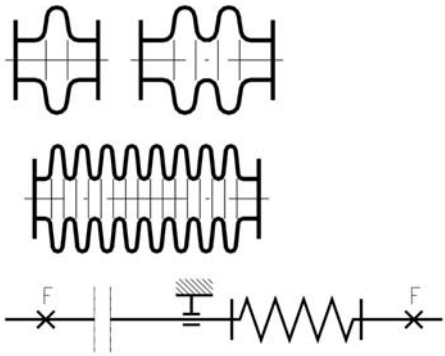
Pre-stressing the flexible section makes it possible to reduce its required length in installations where space is restricted. Pre-stressing also reduces the bending of the flexible section in service, improving the appearance of the pipeline.



**Installing compensators**
The low modulus of elasticity means that the reaction force of plastic pipes to thermal changes is low compared to metal pipes. This makes normal compensators designed for use with metal pipes unsuitable because of their high inherent resistance. Only freely moving compensators may be used in plastic pipe systems, i. e. those with a low resistance. The following compensators may be considered: rubber compensators, PTFE corrugated compensators or suitably selected metal multi-disc compensators.

Carefully placed fixed points should be used when fitting compensators for the regulation of the pipe in order to ensure their unhindered operation. The installation temperature provides the basis for the calculations to ensure this.

**Tip**: When using compensators, additional longitudinal forces are implemented into the pipeline. These forces have to be carried by guiding the pipeline. For example, threaded rods are not suitable. To estimate the lateral forces it can be assumed that they can reach about 15 % of the axial forces. Please contact the manufactures of compensators for further support designing such pipelines.

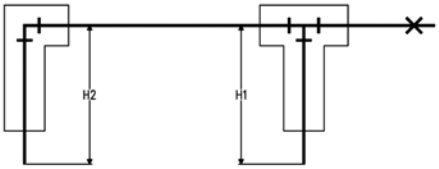


**Installing Valves**
Valves should be secured as directly as possible, so that the actuation forces are transmitted directly and not via the pipeline. Valve brackets or valves from GF with an integrated fastening device are used to securely fasten plastic valves. These valve brackets are also used to bear the loads of the valve and filling weight of the pipeline. Any changes in length which arise can be prevented with the appropriate fixed points before or after the valve. You will find more information under the respective valve types.

## Installing pipework under plaster or embedding it in concrete

**Installing Valves**
Installing pipework under plaster or embedding it in concrete

**Padded pipework**
Where pipework is installed under plaster or embedded into concrete, the flexible sections at bends and branches must be padded for the calculated distance H, as also must any branches and elbows included in the affected section. Use only flexible materials as padding, such as glass wool, mineral wool, foam or similar.



**Unpadded pipework**
Unpadded pipes can also be plastered or concreted in directly. Since the axial stress arising from internal pressure is half as great as the circumferential stress, pipelines can support limited additional axial stress without becoming overloaded. In such cases the level of stress expected must be calculated. The same is true of any section of pipe between two fixed points where no allowance has been made for changes in length. The load at the fixed points must be calculated and considered when planning the fixed points. The distance between pipe brackets in such cases may have to be reduced from the normal values in order to prevent bowing in the pipeline.

Care must be taken to avoid creating cavities when plastering or concreting in the pipeline, because under unfavourable conditions these can become areas of stress concentration. A rich plaster mixture (1 : 3 to 1 :4) should be used to allow the forces arising from temperature variations to be transmitted away without causing the plaster to crack.

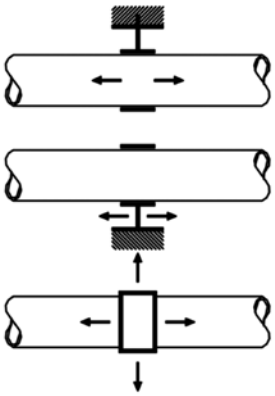
# Installation of metric industrial piping systems

## Pipe bracket spacing and support of pipelines

### General

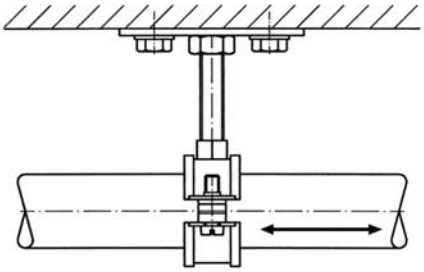
**Pipe support for plastics pipes**
Plastic pipe systems should be installed using supports designed for use with plastics and should then be installed taking care not to damage or over stress the pipe.

**Arranging Loose Brackets**
**What is a loose pipe bracket?**
A loose pipe bracket is a bracket which allows axial movement of the pipe, to allow stress free compensation of temperature changes and compensation of any other operating condition changes



The inner diameter of the bracket should be larger than the outside diameter of the pipe to allow free movement of the pipe. The inner edges of the brackets should be free from any sharp contours which could damage the plastic. If the brackets' inside diameter is not larger than the pipe then the bracket should not be fully tightened, thus allowing the pipe to move.

Another method is to use brackets with spacers which also avoids clamping the bracket on the pipe.



Spacer to avoid clamping

Axial movement of the pipeline must not be prevented by fittings placed next to pipe brackets or by any other component affecting the diameter of the pipe. Sliding brackets and hanging brackets permit the pipe to move in different directions. Attaching a sliding block to the base of the pipe bracket permits free movement of the pipe along a flat supporting surface. Sliding and hanging brackets are needed in situations where the pipeline changes direction and free movement of the pipe must be allowed.

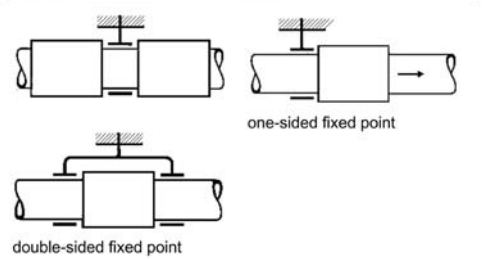
**Arranging fixed points**

**What is a fixed point?**
A fixed pipe bracket is a bracket which prevents the pipe from moving in any direction. The aim of which is to control system stresses caused by temperature changes.

**NOTICE**

**Construction of fix point**
This should not be done by simply clamping the bracket onto the outside of the pipe! This can cause deformation and physical damage to the pipe, damage that sometimes only later becomes visible.

- It should be done either by using pipe brackets located between two fittings or a double bracket must be used.(double-sided fixed point).
- Placing a pipe bracket immediately adjacent to a fitting restricts movement due to changes in length to one direction (one-sided fixed point).



**Information:**
Pipe brackets must be robust and mounted firmly to be able to take up the forces arising from changes in length in the pipeline. Hanging brackets or KLIP-IT pipe brackets are unsuitable for use as fixed points.

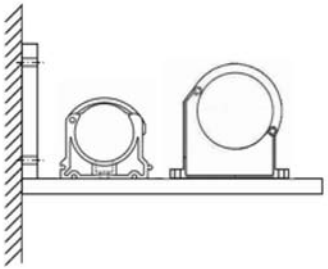
**KLIP-IT pipe brackets**
These robust plastic pipe brackets can be used not only under rigorous operating conditions, but also where the pipework is subject to aggressive media or atmospheric conditions. They may be used for all materials of pipes. Don't use KLIP-IT pipe brackets as fixed points!

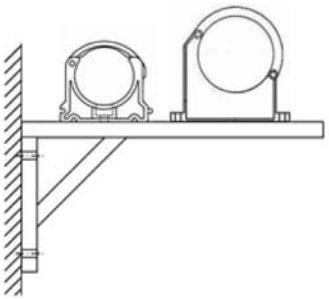
d 16 to d32

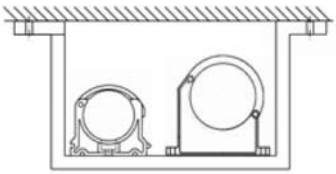
d 40 to d 160

d 90 to d 400

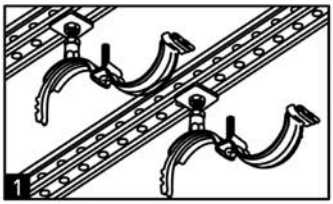
Starting from the dimension d90 the KLIP-IT brackets must be installed standing, like shown in the assembly examples. The support distances given in the following, specified for the KLIP-IT tubing clamps, apply only to this mounting method.



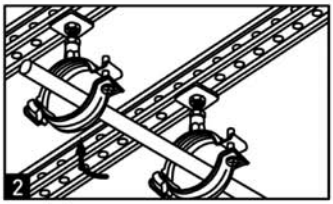




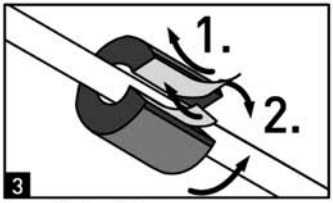
## Pipe brackets for cold insulation (MIP)



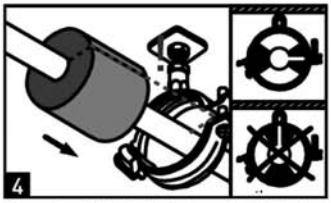
Open handle



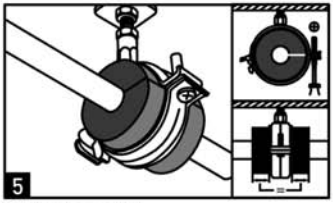
Insert pipe
Close handle with quick-action clamp



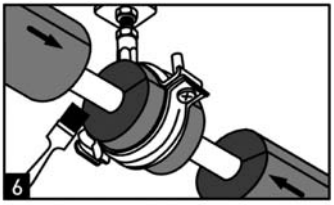
Assemble insulation
1. Take off foil
2. Press area of contact



Move insulation into the bracket. Attention!
Make sure the insulator is positioned correctly.



Tighten the screw

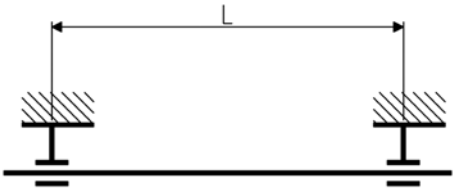


Coat areas of contact with adhesive and bond them

**Using the tables for pipe bracket spacing**
Plastic pipelines need to be supported at certain intervals depending on several factors: the material, the average pipe wall temperature, the density of the medium transported and the size and wall thickness of the pipe. Determining the spacing between pipe brackets is based on the permissible deflection of the pipe between consecutive brackets.

**Information:**
The values given in the tables apply only to pipelines which are freely movable in the axial direction.

Pipelines which are fastened tightly in the axial direction (fixed installations) must be checked for buckling. In most cases, this leads to a reduction of the maximum inner pressure and shorter distances between the support brackets.
Furthermore, the forces that act on the fixed points must also be taken into consideration. For assistance, please contact your nearest GF representative.



# Jointing technology

## Solvent cement jointing

### Instructions for Tangit solvent cement jointing of ABS dimension d16 to d225

#### General

**Solvent cement jointing calls for adequate technical know-how, which can be acquired in the appropriate training courses. Your GF representative will gladly provide you with information about training possibilities.**

The dimensions of GF pipes, fittings and valves conform generally to the various national standards as well as to ISO 727-1 concerning dimensions of sockets. Our fittings and valves can be used with any ABS pipes whose outside diameter tolerance conforms to ISO 11922-1. According to ISO 727-1 the following minimal cement lengths are as shown in the table:

| Pipe outside diameter / socket inside diameter d (mm) | Minimal cement length L (mm) |
|---|---|
| 16 | 13.0 |
| 20 | 15.0 |
| 25 | 17.5 |
| 32 | 21.0 |
| 40 | 25.0 |
| 50 | 30.0 |
| 63 | 36.5 |
| 75 | 42.5 |
| 90 | 50.0 |
| 110 | 60.0 |
| 125 | 67.5 |
| 140 | 75.0 |
| 160 | 85.0 |
| 200 | 105.0 |
| 225 | 117.5 |

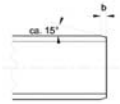
| 75 | 1.3 | 77 |
| 90 | 1.4 | 71 |
| 110 | 1.7 | 59 |
| 140 | 2.1 | 48 |
| 160 | 2.5 | 40 |
| 200 | 3.5 | 29 |
| 225 | 4.5 | 22 |

**Note:** The quantities specified above are to be understood as practice-orientated maximum values. In principle the quantities depend on gap dimensions, temperatures, working technique.

**Preparations**
The pipe must be cut off at right angles. Remove the inside edges and chamfer the outside ones as illustrated in the sketch. Only then is an optimal solvent cemented joint possible.

**Important:** Well-chamfered pipe ends prevent the layer of cement from being removed as the pipe is inserted into the fitting



| Pipe outside diameter | b |
|---|---|
| 16 mm | 1 - 2 mm |
| 20 - 50 mm | 2 - 3 mm |
| ≥ 63 mm | 3 - 6 mm |

Marking the jointing length

Wipe the outside of the pipe and the inside of the socket with a clean cloth to remove obvious dirt. Marking the jointing length on the pipe end makes it possible to check afterwards whether the pipe has been inserted to the full extent of the socket.

**Note:** If the outside diameter of the pipe and the inside diameter of the socket are at opposite extremes of their tolerances, then the pipe cannot be inserted dry into the fitting socket. This will only become possible once the cement has been applied.

Checking the cement

Cleaning the pipe and socket

The Tangit ABS cement is supplied ready for use. Stir thoroughly before using! Cement of the correct consistency will run evenly from a wooden spatula held at a slant. Cement which no longer runs smoothly is unusable.
The cement must not be thinned.

For more information please consult the safety datasheets under the following link:
https://www.sdb.henkel.de/index.cfm

Cement and cleaner should be stored in a cool, dry place (5–35 °C)! Under these conditions the cement and cleaner are durable for 24 months starting from the date of filling (imprinted on the tin).

**Cementing**
Clean the outside of the pipe end and the inside of the socket **thoroughly** with ABS cleaner and absorbent paper.

Use a fresh piece of paper for each component. If the surfaces are free from grease, cleaning with absorbent paper and Tangit cleaner is not absolutely necessary for ABS.
But remove any condensation which may have formed on the parts.

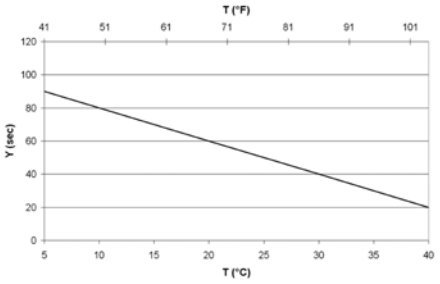
**Important**: Pipe end and fitting socket must be dry and free from grease and dirt and must not be touched after cleaning.

ABS pipes should be cemented at temperatures between +5 °C and +40 °C. Take the following protective measures if the temperatures deviate from the above:

At low temperatures, condensation or ice water which may have formed must be removed, e. g. with warm air. Cement and cleaner should be stored at room temperature. Please observe the waiting times mentioned in the following until the next cementing.

Avoid uneven overheating (->shorten the opening time) when cementing at higher temperatures by protecting the jointing area from direct sunlight.

The quick curing time of the cement necessitates that the joint is made within the opening time after application of the cement has started. The opening time of the ABS cement varies with the ambient temperature and the thickness of the cement applied:



T Temperature in °C / °F
Y Opening time [sec]

Begin by applying a normal layer of cement to the fitting and then a thicker one to the pipe end with firm brush pressure. **Work in wel**l.
The brush strokes should always be in an axial direction. To ensure that both jointing surfaces are completely covered with a smooth, even layer of cement, the brush should be generously loaded with cement.

Applying the cement

The joints can be made single-handed for pipes with diameters up to d63 mm.
For d75 mm and larger pipes, two people are needed to apply the cement to the pipe end and fitting socket simultaneously in order to avoid exceeding the maximum opening time of the cement.

After the cement has been applied, insert the pipe to the full depth of the socket immediately without twisting and bring them into the correct alignment. Ensure that the outlet of the fitting is in the correct position. Hold them in this position to allow the cement to set.

Up to the dimension **d140** wait at least 10 minutes before the next joint, extend the waiting time at temperatures under 10 °C to 15 minutes.

For the dimensions **d160 to d225** wait at least 30 minutes before the next joint, extend the waiting time at temperatures under 10 °C to 60 minutes. In order to avoid any forces on the cemented components by the weight of the piping system a support of the pipeline is necessary.

Remove any surplus cement immediately, using absorbent paper.

A bead of excess solvent cement around the complete external circumference of the joint and a slightly smaller bead again around the complete internal circumference show that the joint has been performed correctly.

After use, clean the brush of excess cement with dry absorbent paper and then clean thoroughly using TANGIT cleaner. Brushes must be dry before being re-used (shake out).

Replace the lid of the cement tin during work breaks

Replace the lid of the cement tin after use to prevent the solvent evaporating. Using the conical lid allows leaving the brush in the cement tin during breaks. Solvent cement dissolves ABS. Pipes and fittings must therefore not be laid on or allowed to come into contact with spilled cement or paper containing cement residues.

Do not close off cement pipelines during the drying process. This is particularly important at temperatures below + 5 °C, when there is otherwise a danger of damaging the material.

After the drying process (see waiting times in the following table) the pipelines can be filled. It is recommended to flush the pipeline before use, and leave it filled with water if it is not directly used.
To ensure the traceability (if necessary) of the used Tangit ABS batch, place the batch marking on the test report. This batch marking is attached to each dispatch unit. If several batches are used in one project, place one marking from each batch on the test report.

**Tangit ABS** Henkel

Charge/Batch-No.: _____

Abfülldatum/Filling date: _____

Diese Chargenkennzeichnung ist auf dem Prüf-/Abnahmeprotokoll anzubringen. / Put this product identification on the final test report.

## Drying period and pressure testing of ABS piping systems d16 - d225

The length of the drying period before the joint may be subjected to testing or operating pressure depends on the ambient temperature, the dimension and the tolerances. The following tables shows the different waiting times.

**Remark**: For temperatures above 20 °C the test pressure must be reduced according to the requirements given in the chapter "Final testing and commissioning".

**Attention**: Care should be taken, if the medium has a large temperature difference to the installation temperature.
Please consult your local GF Representative.

### Internal pressure test with water

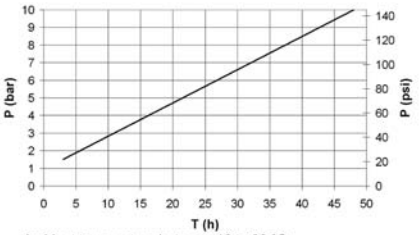
This pressure test shall be carried out according to the information given in the chapter "Internal pressure test with water or a similar incompressible fluid". The waiting time after the last joint until the pressure test is shown in the following table:

| Ambient Temperature | Waiting time |
|---|---|
| 10 ° to 30 °C | min. 24 hours |
| - below 10 °C<br>- above 30 °C | min. 48 hours |

**Attention**: Care should be taken, if the medium has a large temperature difference to the installation temperature.
Please consult your local GF Representative.

### Internal pressure test or leak tightness test with gas/air

Due to the risk of a pressure test with a compressible test medium this pressure test shall be carried out only in exceptional cases! Please consult also the safety precautions given in the chapter "Internal pressure test of ABS pipelines". The following diagram shows the waiting time depending on the test pressure for a ambient temperature between 10 to 30 °C:



Ambient temperature between 10 to 30 °C
P Test pressure in bar, psi
T Waiting time after last joint in hour

### Repair works

If the pipeline is only subjected to the operating pressure with fluids, e. g. after adaptation or repair works, the following rule of thumb for the waiting time applies, which is depending on the diameter:

### Dimension d16 up to d140

**Dimension d16 up to d140**

| Ambient Temperature | Waiting time for testing with fluids (non compressible) |
|---|---|
| 10 ° to 30 °C | 1-hour waiting time per 1 bar operating pressure. |
| - below 10 °C<br>- above 30 °C | 2-hour waiting time per 1 bar operating pressure. |

**Dimension d160 up to d225**

| Ambient Temperature | Waiting time for testing with fluids (non compressible) |
|---|---|
| 10 ° to 30 °C | 2-hour waiting time per 1 bar operating pressure. |
| - below 10 °C<br>- above 30 °C | 4-hour waiting time per 1 bar operating pressure. |

### Safety precautions

Tangit cement and cleaner contain highly volatile solvents. This makes good ventilation or adequate fume extraction essential in closed spaces. Since the solvent fumes are heavier than air, extraction must occur at floor level, or at least below the working level. Place paper which has been used for cleaning or for the removal of surplus cement into closed containers to minimise the amount of solvent fumes in the air.

Cement and cleaner are inflammable. Extinguish open fires before commencing work. Switch off unprotected electrical apparatus, electric heaters, etc. Do not smoke!
Discontinue any welding operations. Furthermore, observe all instructions issued by the solvent cement manufacturer (e.g. label of the tin and any supplementary documentation).

Protect pipes and fittings from spilled solvent cement, cleaner and absorbent paper which has been used to wipe off cement. Do not dispose of surplus solvent cement or cleaner in drainage systems.

The use of protective gloves is recommended to avoid contact with skin. If the cement or the cleaner get in contact with eyes, rinse immediately with water. Consult a doctor! Immediately change clothes that have solvent cement on them.

Always obey the safety regulations issued by the authorities responsible.

Adequate ventilation of the workplace

No open flames when cementing. No smoking.

# Installation of metric industrial piping systems

## Internal pressure test and leak test

### Internal pressure test with water or a similar incompressible test fluid

**General**

The internal pressure test is done when installation work has been completed and necessitates an operational pipeline or operational test sections. The test pressure load should furnish experimental proof of operational safety. The test pressure is not based on the working pressure, but rather on the internal pressure load capacity, derived from the pipe wall thickness.

Supplement 2 of DVS 2210-1 forms the basis for the following information. This replaces the data in DVS 2210-1 entirely. The modifications became necessary because the reference value "nominal pressure (PN)" is being used less and less to determine the test pressure (1.5 x PN, or 1.3 x PN) and is being replaced by SDR,

• a short-term overload or even a reduction in the service life can occur if in the course of the internal pressure test based on the nominal pressure the pipe wall temperature TR = 20 °C is exceeded by more than 5°C.
• Test pressures are therefore determined in relation to SDR and the pipe wall temperature. The 100-h value from the long-term behaviour diagram is used for the test clamping.

**Test Parameters**

The following table indicates recommended methods of testing the internal pressure.

| Object | Pre-test | Main test |
|---|---|---|
| **Test pressure $p_p$** (depends on the pipe wall temperature or the permissible test pressure of the built-in components, see clause "Determining the test pressure") | $\leq p_{p(perm)}$ | $\leq 0.85\ p_{p(perm)}$ |
| **Test duration** (depends on the length of the pipeline, respectively the sections) | L ≤ 100 m: 3 h<br>100 m <L ≤ 500 m: 6 h | L ≤ 100 m: 3 h<br>100 m <L ≤ 500 m: 6 h |
| **Checks** during the testing (test pressure and temperature progression should be recorded) | At least 3 checks, distributed over the test duration **with** restoring the test pressure | At least 2 checks, distributed over the test duration **without** restoring the test pressure |

**Pre-test**

The pre-test serves to prepare the piping system for the actual test (main test). In the course of pre-testing, a tension-expansion equilibrium in relation to an increase in volume will develop in the piping system.
A material related drop in pressure will occur which will require repeated pumping to restore the test pressure and also frequently a re-tightening of the flange connection screws. The guidelines for an expansion-related pressure decrease in pipes are:

| Material | Pressure drop |
|---|---|
| PVC-U | 0.5 bar/h |
| PVC-C | 0.5 bar/h |
| ABS | 0.6 bar/h |
| PP | 0.8 bar/h |
| PE | 1.2 bar/h |
| PB | 1.4 bar/h |
| PVDF | 0.8 bar/h |

**Main test**
In the context of the main test, a much smaller drop in pressure can be expected at constant pipe wall temperatures so that it is not necessary to pump again. The checks can focus primarily on leak detection at the flange joints and any position changes of the pipe.

**Observe if using compensators**
If the pipeline to be tested contains compensators, this has an influence on the expected axial forces of the pipeline. Because the test pressure is higher than the working pressure, the axial forces on the fixed points become higher. This has to be taken into account when designing the fixed points.

**Observe if using valves**
When using a valve at the end of a pipeline (end or final valve), the valve and the pipe end should be closed by a dummy flange or cap. This prevents inadvertent opening of the valve or any pollution of the inside of the valve.

**Filling the pipeline**
Before starting with the internal pressure test, the following points must be checked:
Was installation done according to the available plans?

- All pressure relief devices and flap traps mounted in the flow direction?
- All end valves shut?
- Valves in front of other devices are shut to protect against pressure.
- Visual inspection of all joints, pumps, measurement devices and tanks.
- Has the waiting period after the last fusion / cementing been observed?

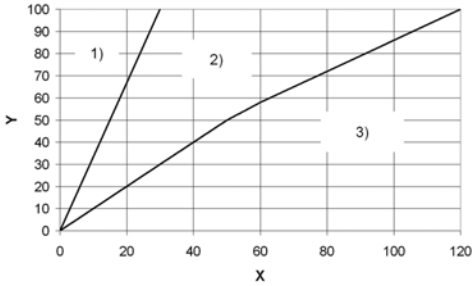
Now the pipeline can be filled from the geodetic lowest point. Special attention should be given to the air vent. If possible, vents should be provided at all the high points of the pipeline and these should be open when filling the system. Flushing velocity should be at least 1 m/sec.

Reference values for the filling volume are given in the following table.

| DN | V (l/sec) | DN | V (l/sec) |
|---|---|---|---|
| ≤ 80 | 0.15 | 250 | 2.0 |
| 100 | 0.3 | 300 | 3.0 |
| 150 | 0.7 | 400 | 6.0 |
| 200 | 1.5 | 500 | >9.0 |

Adequate time should be allowed between filling and testing the pipeline, so that the air contained in the piping system can escape via the vents: ca. 6 - 12 h, depending on the nominal diameter

**Applying the test pressure**



The test pressure is applied according to the diagram.
Here it is important that the pressure increase rate does not cause any water hammer!

Definitions
Y = test pressure in %
X = time for pressure increase in min
1) = pressure increase rate up to DN 100
2) = range of pressure increase rates ›DN 100 - 400
3) = reference values for pressure increase rate DN 500 and greater is: 500 / DN [bar/10 min]

**Determining the test pressure**
The allowable test pressure is calculated according to the following formula:

$$P_{p(perm)} = \frac{1}{SDR} \frac{20\ \sigma_{v(T,100h)}}{S_P\ A_G}$$

with
$\sigma_{v(T,\ 100h)}$ Long-term creep strength for the pipe wall temperature $T_R$ (at t = 100 h)
$S_P$ Minimum safety factor for long-term creep strength
$A_G$ Processing or geometrical specific factor that reduces the allowable test pressure
$T_R$ Pipe wall temperature: average value of test medium temperature and pipe surface temperature

**NOTICE**

**Diaphragm valves, types 514-519**

Don't overload diaphragm valves!

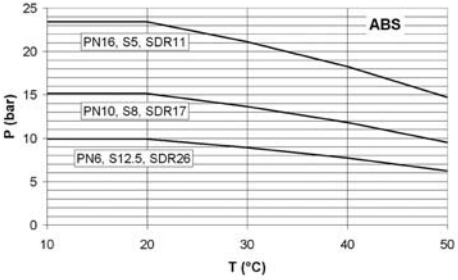
- If the piping system contains diaphragm valves the maximum allowable test pressure is limited to the nominal pressure.

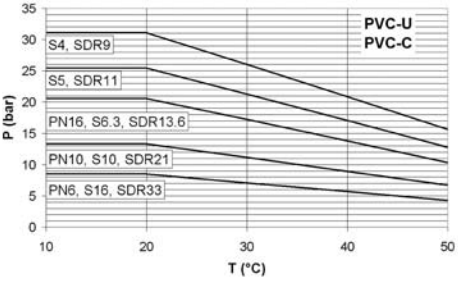
| Material | $S_p$ Minimum safety factor |
|---|---|
| ABS | 1.6 |
| PE80, PE100 | 1.25 |
| PP-H | 1.8 |
| PP-R | 1.4 |
| PVC-U, PVC-C | 2.5 |
| PVDF | 1.4 |

**General**

To make things easier, the permissible test pressures can be taken directly from the following diagrams.

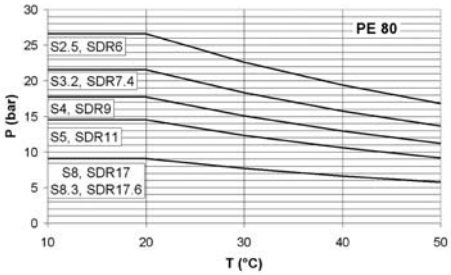
Definitions:
P = permissible test pressure in bar
T = pipe wall temperature in °C

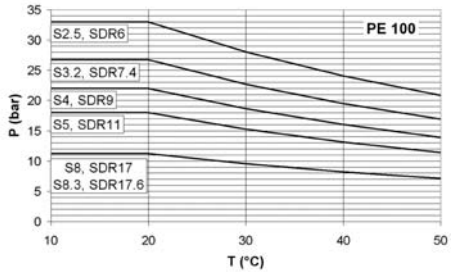


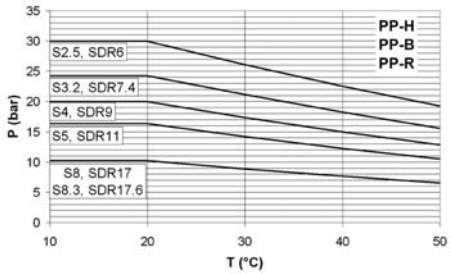


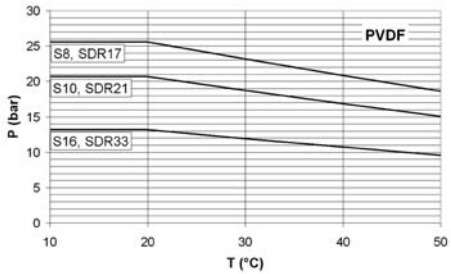
**Checks during testing**

The following measurement values must be recorded consistently during testing:









**General**

- Internal pressure at the absolute low point of the pipeline
- Medium and ambient temperature
- Water volume input
- Water volume output
- Pressure drop rates

# ABS Pressure Pipe Systems

## Standards

George Fischer metric fittings in ABS are generally in accordance with DIN 8063 and the pipe with DIN 16890/16891. George Fischer's inch range of fittings is generally in accordance with BS 5392 and the pipe with BS 5391.

## Sizes (Metric vs Inch)

For those unfamiliar with the difference between metric and inch sizes the following note may be helpful. In imperial systems, the sizes of pipe, fittings and other components such as valves are identified by reference to the nominal size of the bore of the pipe expressed in inches and fractions of an inch.

In metric systems, however, sizes are identified by references to the outside diameter of the pipe expressed in millimetres.

The table below shows the metric sizes which are regarded for practical purposes as being generally equivalent to imperial sizes up to 8 inches. It should, however, be understood that metric sizes are not simply inch sizes which have been converted into millimetres and called metric; their actual dimensions are slightly different and they are, with the exception of 2½" (75 mm) and 5" (140 mm) not interchangeable.

| IMPERIAL SIZES Nominal Bore inches | METRIC SIZES Pipe outside diameter (mm) | Nominal bore (mm) |
|---|---|---|
| 1/4 | 12 | 8 |
| 3/8 | 16 | 10 |
| 1/2 | 20 | 15 |
| 3/4 | 25 | 20 |
| 1 | 32 | 25 |
| 1 1/4 | 40 | 32 |
| 1 1/2 | 50 | 40 |
| 2 | 63 | 50 |
| 2 1/2 | 75 | 65 |
| 3 | 90 | 80 |
| 4 | 110 | 100 |
| 5 | 140 | 125 |
| 6 | 160 | 150 |
| 8 | 225 | 200 |
| 10 | 250 | 250 |
| | 280 | 250 |
| 12 | 315 | 300 |

## Adaptor Union ABS/PVC-U BS Inch - Rp

**Model:**

- Union Bush: PVC-U parallel female thread Rp
- Union End: Solvent cement socket ABS BS inch
- Union nut: PVC-U
- Gasket: O-Ring EPDM No. 48 41 00, FPM No. 49 41 00
- Connection to plastic threads only
- Do not use thread sealing pastes that are harmful to PVC-U

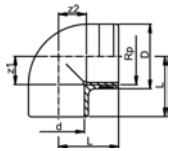
## Elbow 90° ABS metric Rp



**Model:**

- With solvent cement socket metric and parallel female thread Rp
- Reinforcing ring stainless (A2)
- Connection to plastic or metal threads
- Do not use thread sealing pastes that are harmful to ABS
- Install with low mechanical stress and avoid large cyclic temperature changes

# Ball valves

DN10/15 - 50

## Ball valve type 546 ABS
## With solvent cement sockets BS Inch

**Model:**

- For easy installation and removal
- z-dimension, valve end and union nut are **not compatible** with type 346 (DN10/15-50) resp. type 370 (DN65-100)
- Ball seals PTFE
- Without mounting inserts

**Option:**

- Individual configuration of the valve (see diagram)
- Multifunctional module with integrated limit switches
- Pneumatic or electric actuators from +GF+

## With solvent cement sockets BS

**Model:**

- For easy installation and removal (valve end and union nut are compatible with type 546)
- Ball seals PTFE
- Pneumatic or electric actuator available separately
- Angle of operation 360° without turn limiter
- Turn limiter 90° enclosed, in different positions usable as a clip-on ring
- Integrated stainless steel mounting inserts
- Delivery status A-C opened, see flow scheme

## Multifunctional module (I02) PP-GF
## Module empty

**Model:**

- Accessory to Ball Valve Type 546
- Multifunctional module acts as an intermediate element for actuators
- For operation with handle, multifunctional handle has to be ordered separately.
- Including screws to mount the module and stainless steel coupling piece (V2A) for dimension DN65-100
- The multifunctional module from d75 - d110 has a master gauge F07 according to EN ISO 5211.

## Multifunctional module (I04) PP-GF
## With mechanical limit switches Au

**Model:**

- Accessory to Ball Valve Type 546
- Multifunctional module acts as an intermediate element for actuators
- For operation with handle, multifunctional handle has to be ordered separately.
- Including Plug 3P+E / Protection: IP65
- Including screws to mount the module and stainless steel coupling piece (V2A) for dimension DN65-100

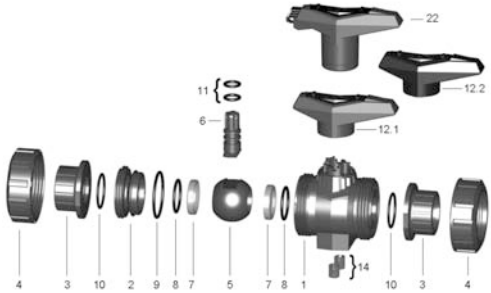
# Spare parts ball valves

## Spare parts ball valve type 546



### Central part

**Model:**

- Every connecting pieces and union nuts are listed on product range industry valves
- Ball seals standard in PTFE
- Central part consisting of: body (1), union bush (2), ball (5), stem (6), ball-, backing-, body-, face- and stem seal (7-11), standard lever (12) and threaded inserts stainless steel (14)

| d [mm] | Inch | DN [mm] | ABS EPDM Code | kg |
|---|---|---|---|---|
| 16 | ⅜ | 10 | **169 480 751** | 0.075 |
| 20 | ½ | 15 | **169 480 751** | 0.075 |

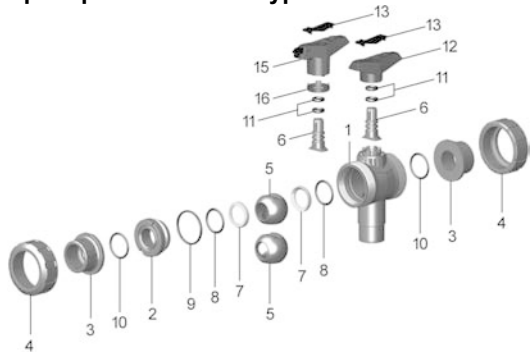
## Assembly kit

**Model:**

- Intermediate element for ball valve type 543 horizontal and electric or pneumatic actuators EA21; PA11/21
- Including screws and position indicator for actuators

| d [mm] | Inch [inch] | DN [mm] | Code | kg |
|---|---|---|---|---|
| 16 - 20 | ⅜ - ½ | 10 - 15 | **167 484 941** | 0.156 |
| 25 - 32 | ¾ - 1 | 20 - 25 | **167 484 942** | 0.181 |
| 40 - 50 | 1 ¼ - 1 ½ | 32 - 40 | **167 484 943** | 0.197 |
| 63 | 2 | 50 | **167 484 944** | 0.236 |

## Spare parts ball valve type 543 vertical



## Central part L-port

**Model:**

- Every connecting pieces and union nuts are listed on product range industry valves
- Ball seals standard in PTFE
- Central part consisting of: body (1), union bush (2), ball (5), stem (6), ball-, backing-, body-, face- and stem seal (7-11) and standard lever (12)

| d [mm] | Inch | DN [mm] | ABS EPDM Code | kg |
|---|---|---|---|---|
| 16 | ⅜ | 10 | **169 481 221** | 0.079 |
| 20 | ⅜ | 15 | **169 481 222** | 0.079 |
| 25 | ¾ | 20 | **169 481 223** | 0.129 |

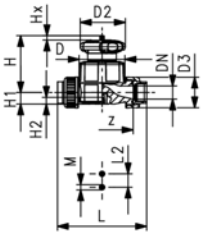
# Diaphragm valves



## Diaphragm valve type 514 ABS
## With solvent cement sockets BS

**Model:**

- Double flow rate compared to predecessor
- One housing nut replaces four screws
- Handwheel with built-in locking mechanism
- For easy installation and removal
- Short overall length

**Option:**

- Individual configuration of the valve (see diagram)
- Self adjusting multifunctional module with integrated limit switches

## Metal - butterfly valve type 037M
## With hand lever

**Model:**

- Housing: Aluminium ASTM S 12A, Rilsan® coated
- Seatliner available in EPDM and FPM

# Strainers

## Line strainer type 305 ABS
## With solvent cement spigots metric

**Model:**

- Protects valves, pumps, etc. from becoming soiled
- Easy dismantling for cleaning the screens
- Cylindrical screen must be ordered separately
- Overall length EN 558
- Screen in stainless steel operable temperature range up -40°C to +60°C
- Screen in PVC-U operable temperature range up 0°C to +60°C

## Backing Flanges, PP-V
## For socket systems metric

**Model:**

- Modern full-plastic flange PP-GF (30 % glass-fibre reinforced)
- With V-groove which applies force evenly on collar
- With integrated bolt retainers as an assembly aid
- UV-resistant. Applicable for outside applications
- Connecting dimension: ISO 7005, EN 1092, BS 4504, DIN 2501
- **Bolt circle PN 10**

## Profile flange gasket metric

**Model:**

- For all metric GF Flange Adaptors
- Profile Gasket with steel insert (type G-ST-P/K)
- Hardness: 70° Shore **EPDM**, 75° Shore **FPM**
- **EPDM:** approved acc. to DVGW W 270, KTW recommendation
- Centering on the inner diameter of the screw crown
- material steel insert: carbon steel
